

QEA BOAT

Kawin Nikomborirak

Boat

Performance Considerations

- The AVS should be 130° to best fit between 120° and 140° .
- The boat will have little velocity, with a pulling force of 0.1 N , so minimize the wet surface friction rather than wave breaking friction.
- The boat should be as long as possible to eliminate vortices.

Actual performance

Righting Moment vs Heel Angle
